EDUCATION

B.Sc.

Computer Science

Riphah International University

September 2021 – July 2025

Islamabad, I-14

[Verify](#)

SKILLS

Python,

Computer Vision, RAG,

LangGraph, LangChain,

Microsoft Azure, Prompt

Engineering, n8n, Vibe

Coding (Flutter, Node.js,

TypeScript,

HTML, CSS, JS,

Bootstrap), Git &

Firebase.

LANGAUGES

Pashto, Urdu, &

English

SUMMARY

Results-driven Computer Science graduate with a strong foundation in Artificial Intelligence and automation. Proficient in Python, machine learning, and AI concepts, with hands-on experience in building AI workflows and automation systems through personal projects and training. Developed a practical understanding of key tools and frameworks, including LangChain, LangGraph, and n8n. Eager to leverage problem-solving skills to contribute to a dynamic team and build innovative code-based agents and automation solutions.

WORK EXPERIENCE

ARTIFICIAL INTELLIGENCE TRAINING

Hands on GenAI Projects

September 2025 – November 2025 (Adan Institute of Technology)

- Python Programming Essentials — writing clean code, using data structures, building small applications.
- SQL & Database Handling — designing tables, writing queries, integrating Python with databases.
- AI & LLM Fundamentals — understanding embeddings, transformers, and how modern AI models work.
- RAG Pipeline Skills — chunking documents, creating embeddings, vector search, and building question answering systems.
- LangChain & LangGraph — creating RAG chains, agents, and multi-step AI workflows.

FINAL YEAR PROJECT

Hair Loss Detection & Prevention System

June 2024 – June 2025 (Riphah International University)

- This project is an AI-based system for hair loss categorization and classification using scalp images. It uses deep learning and computer vision to identify different hair loss patterns from images.
- The system applies Convolutional Neural Networks (CNNs) with pretrained models such as ResNet50V2 and DenseNet169, along with a custom CNN, to classify scalp images into hair loss categories with good accuracy. Data augmentation is used to improve model performance and reduce overfitting.
- The model analyses feature like hair density, thinning areas, and scalp condition to give basic assessments. This project mainly focuses on image classification and pattern recognition, rather than full medical diagnosis or treatment.
